Linearity

As a basis of assessing Linearity Tolerance the independent method is the most practical, permitting as it does, the reference curve to be aligned as near as possible to the actual output curve. This avoids the use of the theoretical starting and finishing points, it is normal for the customer to realign the achieved curve with series trimmers at each end of the device if required.

Linearity Tolerance is 4% over the Nominal Resistance range of 1K0 to 1M0. The Linearity Tolerance is measured on at least 70% of the effective rotation range.

Note. In the case of Terminal and Zero-based linearity, both present constraints which increase the manufacturing difficulty and in consequence have an adverse effect on the product's price and availability.

Potentiometer linearity

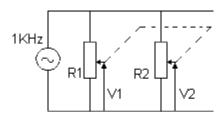

Matching Tolerance (For Tandem Stereo Potentiometers)

Tandem Potentiometers have two identical resistor units with the same variation law. The mismatching of the two resistor units, expressed in dB, is measured by the difference between the attenuations introduced by each resistor unit at various points of travel.

- Law A: 4 dB at Attenuation range 0 20 dB
- Law B and C: 3 dB at Attenuation range 0 20 dB

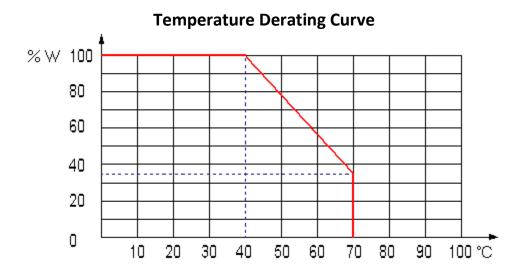

Matched Tolerance for Stereo

LAW	ATTENUATION RANGE	MATCHING TOLERANCE*
Α	0 - 20dB	4dB
B&C	0 - 20dB	3dB

*Matching Tolerance = 20 Log $\frac{\sqrt{1}}{\sqrt{2}}$

Operating Temperature: -25°C to +70°C

Temperature Coefficient of Resistance: +300 -500 ppm
